

Long-term ECG

Long-term ECGs are a diagnostic method that constantly records an electrocardiogram during a whole day and night.

A long-term ECG is necessary:

- for detecting cardiac arrhythmias
- if you suffer from heart race or nausea
- after collapsing / unconsciousness
- for monitoring heart rhythm stabilising therapies
- if you suffer from thoracic pain and shortness of breath
- for monitoring heart diseases

The procedure

Measurement is accomplished via six electrodes placed on your chest area. The recorder is very small and light which enables patients to carry out their normal daily routine.

Your benefits

The long-term ECG is used for early detection and early treatment.
